DETAILED ACTION

Claim Rejections - 35 USC § 102

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless -

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

Claims 1, 3-5, 7, 9-11 and 17-28 are rejected under 35 U.S.C. 102(b) as being anticipated by Crammond (US Patent 5,485,873) or Bielagus et al (US Patent 5,937,923) or Swartwood et al (US Patent 5,979,522).

The device of Crammond or Bielagus et al or Swartwood reads on the elements of the claimed invention including a knife (60, 36 or 12, respectively), a base (58, 34 or 22, respectively), a wear shoe (68, 42 or 16, respectively), an upper clamping (66, 76 or 14, respectively), at least one bolt (70--fig. 7, 78 or 40, respectively). The Examiner takes the position that the gap is greater than the thickness of the knife and the angle is about 5 degrees. Further, the gap of the device of Crammond or Bielagus et al or Swartwood would have to be greater in order for knife to have a friction fit when inserted between the upper clamp and wearshoe.

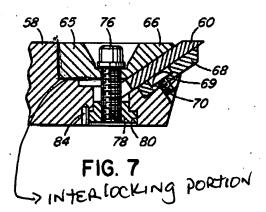

Response to Arguments

Applicant's arguments filed 02/06/07 have been fully considered but they are not persuasive. In response to applicant's remarks that Crammond fails to teach a gap

Art Unit: 3725

between the upper clamping member and the wearshoe that is greater than the thickness of the knife, the applicant's attention is directed to the above rejection.

In response to applicant's remarks that Crammond fails to teach the wearshoe and base include "cooperatively interlocking portions adapted to substantially prevent movement of said base, relative to said wearshoe, in a first direction toward the knife and perpendicular to the axis of said bolt, said interlocking portions meeting so as to define an angle ϕ with respect to said first direction that is in the range 45 - 60 degrees", applicant's attention is directed to the below marked copy figure 7.

Further, in col. 5, lines 3-5 of Bielagus, member 65 is forced into contact with knife 60 and counter knife 68 via member 78 to clamp the knife package to the carrier 58. The examiner takes the position that the interlocking portion of the wearshoe and base define an angle of the specified range noted above.

In response to applicant's remarks that the Crammond fails to teach assemblies for installation between the end plates such that shoulder portions of at least two shoulder bolts extend through one of the end plates into the base, it should be noted that the claim does not positively recite the shoulder portions of at least two shoulder bolts in combination with the claimed apparatus. The examiner wishes the applicant to

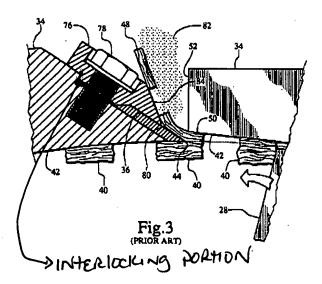

Art Unit: 3725

note that it has been held that a recitation with respect to the manner in which a claimed apparatus is intended to be employed does not differentiate the claimed apparatus from a prior art apparatus satisfying the claimed structural limitation.

In response to applicant's remarks that Bielagus et al fail to teach an upper clamping member be "cantilevered" from the base, the examiner disagrees. Figure 3 shows clamp 76 supported by a projection surface of 34 in which the projection provides a cantilevered support for clamp 76. Bolt 78 is then used to force clamp 76 in contact with the knife. Therefore, the device of Bielagus et al, meet the claimed limitation. Further, in response to applicant's remarks that Bielagus et al fail to teach a gap between the upper clamping member and the wearshoe that is greater than the thickness of the knife, the applicant's attention is directed to the above rejection.

In response to applicant's remarks that Bielagus et al fail to teach the wearshoe and base include "cooperatively interlocking portions adapted to substantially prevent movement of said base, relative to said wearshoe, in a first direction toward the knife and perpendicular to the axis of said bolt, said interlocking portions meeting so as to define an angle ϕ with respect to said first direction that is in the range 45 - 60 degrees", applicant's attention is directed to the below marked copy figure 3.

Art Unit: 3725

In response to applicant's remarks that the Bielagus et al fail to teach assemblies for installation between the end plates such that shoulder portions of at least two shoulder bolts extend through one of the end plates into the base, it should be noted that the claim does not positively recite the shoulder portions of at least two shoulder bolts in combination with the claimed apparatus. The examiner wishes the applicant to note that it has been held that a recitation with respect to the manner in which a claimed apparatus is intended to be employed does not differentiate the claimed apparatus from a prior art apparatus satisfying the claimed structural limitation.

In response to applicant's remarks that Smartwood fails to teach a gap between the upper clamping member and the wearshoe that is greater than the thickness of the knife, the applicant's attention is directed to the above rejection.

In response to applicant's remarks that Smartwood fails to teach the wearshoe and base include "cooperatively interlocking portions adapted to substantially prevent movement of said base, relative to said wearshoe, in a first direction toward the knife and perpendicular to the axis of said bolt, said interlocking portions meeting so as to

Art Unit: 3725

define an angle ϕ with respect to said first direction that is in the range 45 - 60 degrees, the examiner agrees.

In response to applicant's remarks that the Smartwood fail to teach assemblies for installation between the end plates such that shoulder portions of at least two shoulder bolts extend through one of the end plates into the base, it should be noted that the claim does not positively recite the shoulder portions of at least two shoulder bolts in combination with the claimed apparatus. The examiner wishes the applicant to note that it has been held that a recitation with respect to the manner in which a claimed apparatus is intended to be employed does not differentiate the claimed apparatus from a prior art apparatus satisfying the claimed structural limitation.

Conclusion

THIS ACTION IS MADE FINAL. Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the mailing date of this final action.
